- Designed to support online business

- No single points of failure

- Quality audited

- State of the art e-business friendly MPLS network delivers performance to your customers

- Located in the premier jurisdiction for online business

- Peace of mind through partnership with e-business experts

The Premier Offshore Datacentre

Domicilium operate the largest and most technologically advanced offshore datacentre designed specifically to meet the exacting demands of online businesses.

Located at the heart of the British Isles in the Isle of Man, a premier offshore jurisdiction, our 20,000sq ft facility is designed to meet the space, power and cooling requirements of the largest online businesses. This fully resilient facility has been carefully designed from the ground up to remove all single points of failure and to rigorous international standards.

Conveniently located within five minutes of the airport in a secure compound, our datacentre is protected by multiple tiers of physical and logical security restricting access to authorised engineers and customers.

Domicilium was established in 1995 as one of the first Internet Service Providers in Europe. Our customers benefit from some of the most skilled and experienced expertise available backed by the highest levels of care and enterprise-class service level agreements.

Domicilium operates its own network core which extends diversely from our co-location facilities in the Isle of Man into Manchester and the heart of the European communications

hub in London Telehouse. As members of the London Internet Exchange (LINX) we deliver optimal performance to you and your customers by peering with all major Tier-1 providers.

"We provide peace of mind that your investment is in safe hands."

Implemented in 2004, we deliver network connectivity across our switched MPLS backbone which has been designed from the ground up to exceed the stringent latency, throughput and jitter demands of highly risk averse businesses including the financial services sector.

The combination of highly resilient co-location facilities, high capacity Distributed Denial of Service (DDoS) protection and multiple redundant network paths make Domicilium the preferred choice for both primary and disaster recovery applications.

We provide complete peace of mind that your business is in safe hands.
